Liners

aranzu offer a range of replaceable liners to suit most applications. These replaceable liners can be used to replace existing or failed liners or as an alternative to unlined process equipment.

Design → Our liners are custom designed to meet the requirements of the existing process. The material selection for the wear-resistant liner is key to ensure the longevity of the units. **aranzu** select either a cast alloy or wrought plate material based on the required application. For low impact, high abrasion applications, softer rubber or polyurethane liners can be offered.

Application → The liners are suited to all high impact, high abrasion environments, where the existing liner is not achieving the required service life. Alternatively, **aranzu** can provide custom liners to suite existing unlined process equipment.

Variations → Examples of the liners provided are mill chute liner retrofits, lined pipe sections for dredging and replacement liners for scraper and cutter faces.

Custom Requirements → The liners are custom designed to meet the client's requirements.
